

Data and calculation notes

The submission email asked for calculation files (Excel and/or code). This exercise publishes estimates from a cleaned sample dataset. The calculation artifact is the CSV plus the seed/query code, not a workbook of invented forecasts.

Source file

data/kpi_sample_2000.csv — 2,000 records, columns: company_name, ticker, sector, kpi, period_start, period_end, period, estimate_type, value, unit, as_of.

How numbers are produced

- Repeatable load: `python -m app.seed` (reset + insert all 2,000 rows).
- No derived growth rate is stored. Net-added subscribers stay a count (unit: subs).
- Latest QTD selection is SQL window/order by as_of descending, not calendar “today”.
- Reviewers can recompute any figure by filtering the CSV on ticker, kpi, period, estimate_type, as_of.

Reference figures used in tests (from the CSV)

Ticker / KPI	Period	Type	as_of	Value	Unit
IGC Total Revenue	2026Q1	qtd latest	2026-03-15	627.45	\$MM
IGC Total Revenue	2026Q1	qtd	2026-01-31	263.09	\$MM
IGC Total Revenue	2026Q1	qtd	2026-02-15	395.67	\$MM
IGC Total Revenue	2026Q1	qtd	2026-02-28	503.52	\$MM
IGC Total Revenue	2022Q1	historical	—	519.63	\$MM
IGC Total Revenue	2025Q4	historical	—	945.3	\$MM
ACME ASP	2026Q1	qtd latest	2026-03-15	164.22	\$

These values are copied from the sample, not computed by extrapolation. A reviewer can open the CSV and match the same rows. Code that selects latest QTD is `backend/app/services/kpi.py` (latest as_of). Import is `backend/app/seed.py`. Tests in `backend/tests/` lock these figures.

Central Data Team context (as applied)

The accompanying team overview was treated as background, not as a second spec. Applied assumptions: customers are public investors who need a short answer with units and dates; datasets are already cleaned and land in Postgres; QTD snapshots update at most daily; the assistant should reduce portal digging, not replace the warehouse; authentication is out of scope for this build but tenancy must be designed for later. No team member names or internal org details are repeated here.

What is intentionally absent

- No Excel forecast file — inventing one would contradict “do not extrapolate QTD”.
- No candidate name, resume, or personal metadata on this document.
- No API keys. `.env` is excluded from the ZIP; `.env.example` is included.
